

Senior Product Manager, Data Platform

Meridian Labs · Full-time · Remote (US) or Austin, TX

About the role

Meridian Labs builds infrastructure that helps mid-market companies unify and analyze their operational data. We're hiring a Senior Product Manager to own our Data Platform product line — the pipelines, transformation tools, and internal APIs that power every customer-facing analytics feature we ship. You'll set the roadmap for a platform used by every other product team in the company, working closely with engineering leadership, data science, and enterprise customers.

Responsibilities

- Own the strategy and roadmap for the Data Platform, balancing near-term reliability and performance work against longer-term platform investments.
- Partner with engineering to define system-level requirements for data ingestion, transformation, and storage that other product teams build on top of.
- Work directly with large enterprise customers to understand data volume, latency, and compliance requirements, translating them into prioritized platform work.
- Define and track platform health metrics (pipeline reliability, data freshness, API latency) and drive quarterly improvement targets.
- Act as the internal voice of the platform for other product teams, running a lightweight intake process for new platform requests.
- Present roadmap and quarterly results to executive leadership and, periodically, to key enterprise accounts.

Requirements

- 5+ years of product management experience, including platform, infrastructure, or data-heavy products.
- Comfortable reading SQL and working directly with engineers on system design tradeoffs, without needing to write production code.
- Track record of shipping products that other internal teams or external developers build on top of (platform or API experience strongly preferred).
- Strong written communication; able to turn ambiguous technical tradeoffs into a clear roadmap for both engineers and executives.
- Experience working with enterprise customers with formal data governance or compliance requirements.

Nice to have

- Experience in healthcare, fintech, or another regulated industry.
- Prior experience as a data analyst or data engineer before moving into product management.
- Familiarity with modern data-stack tools (dbt, Airflow, Snowflake, or similar).

What we offer

Competitive salary and equity, fully remote-friendly with an optional Austin office, comprehensive health coverage, and a professional development budget. Meridian Labs is an equal opportunity employer.
